

Slip Resistant Additive Datasheet

March 2014**Page 1 of 1**

White fine granules.

Purpose

To increase the slip resistance of sealers on floors.

Advantages

- Disperses readily and evenly through sealer.
- Slow to settle or float in sealer.
- Polymeric in nature, therefore, more compatible physically with sealers eg. expansion / contraction.
- Generally increases abrasion resistance of sealers.
- Compatible with solvent and water based systems.
- Does not detract from aesthetic appeal of most decorative surface. In some cases enhances appearance.

Preparation

Prior to sealing, mix the required amount of the selected slip reducer into the final coat of sealer. Ensure sealer is applied using a suitable roller. Extend the final sealer coat thinly to ensure the texture created by the slip reducing additive is visual. The coverage will depend on texture. Some settling or flotation can occur, therefore, stir mix periodically (2 minute intervals).

Limitations

- If left in some solvent type sealer for extended period (>4 hours). There is a tendency for swelling and sticking together of particle.
- As with most materials it will slowly wear, hence periodic check of slip resistance is advisable.
- May dull gloss retention

Coverage

Depends on type of sealer used. Refer to its datasheet.

Packaging

Supplied in buckets of 90g's, 360g's and 450g's

Cemcrete provides a comprehensive technical service based on over 3 decades of experience in the field of surface applications and cement technology. Cemcrete believes, to the best of its knowledge, that the information contained herein is true and accurate at the date of issuance and is subject to change without prior notice.
